DBIM SESSION 1 - HANDS-ON WORKSHEET

Service Desk Automation: Value-Chain Mapping

Use Case Orchestration & SSOT Thinking • Bite-Sized Approach • Discovery → Rationalization

Field	Fill in
Name(s)	P Annapurna
Group / Team	
Date	
Real organization chosen for the Capstone (Part D)	

How to use this worksheet

This worksheet runs alongside the Session 1 slide deck. Every part references the same fictional company, TechNova Solutions, that the slides walk through - so read the matching slide section first, then fill in your own version here. Part D (Capstone) is where you leave TechNova behind and apply everything to a real organization.

- Part A – SSOT Use Case Charter (10 min, individual or pairs)
- Part B – Bite-Sized Value Chain Breakdown (12 min, individual or pairs)
- Part C – Discovery → Rationalization Mini-Workshop (15 min, groups of 3–4)
- Part D – Capstone: Real-World Application (take-home, groups of 3–4)

Part A - Build an SSOT Use Case Charter

Context: TechNova's Service Desk also struggles with laptop provisioning delays for new hires - it currently takes 5+ days, and the story lives across an onboarding spreadsheet, IT's ticketing queue, and Slack DMs to the hardware vendor. No one owns the end-to-end picture.

Reference - worked example from the slides

Use case: Auto-resolve password reset tickets | Owners: IT Ops Lead / Automation Eng Lead | KPI: Cut resolution time 26h → 15 min, save $9/ticket | Data sources: ServiceNow ticket API, AD user directory | Scope boundary: password reset only - NOT account lockout | Status: Discovery complete → Rationalized

Your task: complete this SSOT charter for the laptop provisioning use case.

Field	Your answer
Use case name	Laptop Provisioning
Business owner (name a role, not a department)	HR Onboarding Manager
Tech owner (name a role, not a department)	IT Automation Lead
KPI / value hypothesis (must be measurable in 8–10 weeks)	Reduce laptop provisioning time from 5+ days to 2 days within 8-10 weeks.
Data sources this use case will need	Onboarding spreadsheet, IT ticketing queue, vendor records, employee directory.
Scope boundary - what is explicitly OUT of scope?	Purchasing, vendor contract changes, mobile devices, and other onboarding tasks.
Current status (Discovery / Rationalized / In Build)	Discovery

Reflection

Without a single shared charter like this one, name ONE way the business team and the engineering team could end up building two different things for the same use case.

Business and engineering could choose different scope and KPIs, so they may build different solutions for the same use case.

Part B - Break Down a Big Bang Problem

Context: TechNova leadership just announced, “We want a fully automated employee onboarding experience.” That is a Big Bang statement - too large, too vague, too slow to show value. Your job: decompose it into a value chain of bite-sized use cases, the same way the slides broke “automate the service desk” into 5 steps.

Reference - the Service Desk value chain from the slides

1. Ticket Intake & Classification → 2. Auto-Routing → 3. Auto-Resolution (FAQs, Password Reset) → 4. Escalation & SLA Monitoring → 5. Feedback & Improvement Loop. Each step is its own 8–10 week sprint with its own owner and KPI.

Your task: map the Employee Onboarding value chain into 4–6 bite-sized use cases.

#	Use case name	What it delivers on its own	Sprint length
1	New Hire Information Collection	Collects employee details, documents before joining	4-5 Weeks
2	Account & Access Provisioning	creates email, system accounts, and access permissions .	2-3 Weeks
3	Onboarding Status Notifications	Sends automatic reminders and status updates to the employee, manager, and HR	6 weeks
4	Training Schedule Automation	Automatically assigns orientation and training sessions based on the employee's role.	6-7 weeks
6	Onboarding Feedback	Collects employee feedback and identifies onboarding process improvements.	5-6 weeks

Sequencing

Which use case from your table above could go live FIRST and deliver value completely on its own, before any of the others exist? Why that one?

Dependency

Name ONE pair of use cases from your table where one clearly depends on the other being built first.

Part C - Discovery → Rationalization Mini-Workshop

Groups of 3–4. Assign roles: one Business Owner, one Tech Lead, one QA/Ops rep (a 4th person can be Facilitator/Scribe). You are rationalizing candidate use cases for TechNova's onboarding transformation - start from your Part B list and add more.

Reference - the scoring matrix from the slides

Score every candidate 1–5 on Business Impact, Feasibility, and Strategic Alignment. Add the three scores for a Total out of 15. In the worked example, "Password reset auto-resolve" scored 5+5+5 = 15 and won the next sprint slot over five other candidates.

Step 1 (5 min) - Discovery: brainstorm without judging

List every friction point your group can think of in employee onboarding - include your Part B use cases AND at least 4 new ones (equipment, HR paperwork, access provisioning, buddy assignment, training modules, facilities access, payroll setup, etc.).

#	Candidate use case (one line, raw, unfiltered)
1	New Hire Information Collection
2	Account & Access Provisioning
3	Onboarding Status Notifications
4	Training Schedule Automation
5	Onboarding Feedback
6	HR Document Verification
7	Mentor Assignment
8	Facilities & Office Access Setup
9	Payroll and Bank Account Setup

Step 2 (5 min) - Rationalization: score every candidate

Candidate	Business Impact (1–5)	Feasibility (1–5)	Strategic Alignment (1–5)	Total
New Hire Information Collection	5	5	5	15
HR Document Verification	5	4	4	13
Account & Access Provisioning	5	4	4	13
Onboarding Status Notifications	3	5	4	12
Training Schedule Automation	4	4	5	13
Mentor Assignment	3	5	3	11
Facilities & Office Access Setup	4	3	4	11
Payroll and Bank Account Setup	3	3	4	10
Onboarding Feedback	3	4	2	9

Step 3 (5 min) - Decide and defend

Top-ranked use case (goes into the next sprint):

Why this one and not the second-highest scorer? What would make you override the numbers?

Part D - Capstone: Real-World Application

TechNova was the training wheels. Now pick a REAL service desk, help desk, or support function you have direct access to or can interview someone from - e.g. your college IT/hostel/facilities help desk, an internship company's support team, or a campus admin office. Apply all three DBIM tools to it, end to end.

Step 0 - Pick your organization

Organization / function chosen	College Hostel Facilities Help Desk
Who did you talk to (name / role)?	Hostel Facilities Coordinator

D1. SSOT Use Case Charter

Identify the single highest-friction problem in this support function and write its charter.

Field	Your answer
Use case name	Maintenance Request Intake & Tracking
Business owner	Hostel Facilities Coordinator
Tech owner	Facilities Systems Lead
KPI / value hypothesis	Reduce average maintenance resolution time from 3 days to 1.5 days and automatically classify/route 80% of requests within 8–10 weeks.
Data sources	Maintenance request log, hostel room allocation records, asset register, vendor records, and email.
Scope boundary	Major construction projects, emergency incidents, procurement, hostel discipline issues, and non-maintenance complaints.

D2. Bite-Sized Value Chain Map

Map the broader transformation this problem sits inside, as 4–6 sprint-sized use cases.

#	Use case name	What it delivers on its own	Sprint length
1	Maintenance Request Intake & Classification	Captures hostel maintenance requests through a standard form and categorizes them by issue type.	3–4 Weeks
2	Auto-Routing to Maintenance Teams	Routes categorized requests to electrical, plumbing, housekeeping, or facilities teams; depends on Step 1.	3–4 Weeks
3	Work Order Scheduling & Assignment	Assigns work orders to available staff or vendors and provides a clear schedule.	4–5 Weeks
4	SLA Escalation & Status Updates	Flags overdue requests and sends automatic status updates to students and hostel staff.	4–5 Weeks
5	Resolution Feedback & Improvement Loop	Collects feedback after resolution and identifies recurring hostel maintenance problems.	5–6 Weeks

#	Use case name	What it delivers on its own	Sprint length

D3. Discovery → Rationalization

List at least 8 real candidate problems you found (from your interview or direct observation), then score and rank them.

#	Candidate use case
1	Maintenance Request Intake & Classification
2	Auto-Routing to Maintenance Teams
3	Electrical & Plumbing Issue Reporting
4	Room Cleaning / Housekeeping Requests
5	Water Supply & Washroom Issue Reporting
6	Work Order Scheduling & Assignment
7	SLA Escalation & Status Tracking
8	Maintenance Knowledge Base / FAQ Self-Service

Candidate	Business Impact (1–5)	Feasibility (1–5)	Strategic Alignment (1–5)	Total
Maintenance Request Intake & Classification	5	5	5	15
Auto-Routing to Maintenance Teams	5	4	5	14
Work Order Scheduling & Assignment	5	4	4	13
Electrical & Plumbing Issue Reporting	4	4	4	12
Room Cleaning / Housekeeping Requests	3	5	4	12
Water Supply & Washroom Issue Reporting	4	3	4	11
SLA Escalation & Status Tracking	4	4	5	13
Maintenance Knowledge Base / FAQ Self-Service	3	4	4	11

Top-ranked use case and why:

Maintenance Request Intake & Classification — it has the highest combined score (15) because it directly reduces delays in reporting hostel maintenance problems, is feasible to implement, and supports the later routing and tracking steps. It is preferred over the next-highest candidates because it improves the starting point for every maintenance request.

D4. Reflection (150–200 words)

Think back on your Parts A–D. Pick ONE moment where skipping SSOT thinking, bite-sizing, or rationalization would have caused real damage in your chosen organization - and explain what would have gone wrong.

Grading Rubric

Deliverable	What we're looking for	Weight
SSOT Use Case Charter (Part D1)	Named owners (not departments), a KPI you could actually measure in 8–10 weeks, a real scope boundary	25%
Bite-Sized Value Chain Map (Part D2)	4–6 genuinely sprint-sized use cases, logical sequencing, one dependency explicitly called out	25%
Discovery → Rationalization Matrix (Part D3)	8+ genuine candidates from real observation/interview, honest (not inflated) scoring, a defensible top pick	30%
Reflection (Part D4)	Specific moment identified, clear reasoning about what structure prevented or would have prevented	20%

Submit this worksheet (Parts A–D completed) before Session 2.
