DBIM SESSION 2 — HANDS-ON WORKSHEET

Business Prioritization, ROI Logic & the Use-Case Pitch

Weighted Impact Scoring • Value Mapping & ROI • Discovery → Rationalization → Pitch Workshop

Field	Fill in
Name(s)	P Annapurna
Group / Team	
Date	
Real organization continued from Session 1	

Before you start

This worksheet continues directly from your Session 1 worksheet. Keep that document open — you'll pull your Employee Onboarding value chain (Part B) and your rationalization scores (Part C) into Part A here. Part D is again the real-organization capstone, continuing what you started in Session 1's Part D.

- Part A – Weighted Priority Scoring (12 min, individual or pairs)
- Part B – Value Mapping Canvas + ROI + Feasibility (15 min, individual or pairs)
- Part C – Discovery → Rationalization → Live Pitch Workshop (~50 min, groups of 3–4)
- Part D – Capstone: Real-World Application, continued (take-home, groups of 3–4)

Part A — Weighted Priority Scoring

Bring in your Employee Onboarding value chain from Session 1, Worksheet Part B (your 4–6 bite-sized use cases). Score every one on all five factors below, then apply the weighted formula.

Reference — the formula from the slides

Priority Score = (Impact × 3) + (Feasibility × 2) + (Strategic Alignment × 2) + (Urgency × 1) − (Risk × 1). In the TechNova example, Password reset auto-resolve scored 5/5/5/4/1 for a weighted total of 38 — clearly ahead of the next-best candidate at 27.

Your task: weighted-score your onboarding use cases

Use case	Impact ×3	Feas. ×2	Align. ×2	Urg. ×1	Risk −1	Weighted Total
New Hire information collection	5	5	5	5	1	39
Account & Access Provisioning	5	4	4	5	2	34
Training Schedule Automation	4	4	5	4	1	33
Onboarding Status Notifications	3	4	4	4	1	28
Onboarding Feedback	3	4	2	3	1	23

Reflection

Did any use case's rank change between your Session 1 simple score and today's weighted score? Which one, and why did the weighting move it?

Yes,The weighted scoring gives more importance to Impact, so higher-impact use cases like New Hire Information Collection and Account & Access Provisioning moved ahead.

Part B — Value Mapping, ROI & Feasibility

Take your #1 weighted-priority use case from Part A. Build out its full value mapping canvas, then estimate ROI and score feasibility — exactly as we did for TechNova's password reset bot.

Reference — the TechNova ROI math from the slides

Monthly savings: 4,340 tickets × $19 = $82,460. Annual value: $989,520. Build cost: ~$74,000. ROI: (989,520 − 74,000) ÷ 74,000 ≈ 12.4×. Payback: ~27 days. It's fine if your numbers are rougher — state your assumptions clearly.

B1. Value Mapping Canvas

Field	Your answer
Business Goal	Reduce delays and manual effort in collecting new-hire information.
Use Case	Automated New Hire Information Collection
KPI	Reduce the average time taken to collect information from 2 days to less than 5 hrs.
Value Delivered (in $ or time)	Saves HR time, reduces follow-ups and helps new employees complete onboarding faster.

B2. ROI Calculation

Line item	Your estimate
Monthly savings / value (show your math)	200 new employees× 20 min ÷ 60 × ₹1,500 × 80% = **₹80,000/month**
Annual value delivered	₹80,000 × 12 = **₹9,60,000/year**
Estimated build cost (8–10 wk sprint)	₹4,00,000
ROI = (Annual value − Build cost) ÷ Build cost	(₹9,60,000 − ₹4,00,000) ÷ ₹4,00,000 = **1.4×**
Payback period	₹4,00,000 ÷ ₹80,000 = **5 months**

B3. Feasibility Check (score 1–5 each)

Lens	Score (1–5)	Why
Technical	5/5	use existing HR forms, email and onboarding systems.
Data	4/5	Required new-hire information is already collected by HR.
Organizational	4/5	HR and managers need to adopt the standardized process.

Weakest lens and the biggest risk it creates for this use case:

Organizational — 4/5. The biggest risk is low adoption if HR and managers continue using emails or spreadsheets.

Part C — Discovery → Rationalization → Pitch Workshop

Same groups as Session 1. New problem area: TechNova's IT asset & equipment request backlog (laptops, monitors, software licenses, replacement parts — currently a mix of email requests and a shared spreadsheet, no SLA, frequent duplicate orders).

Step 1 (8 min) — Discovery + Weighted Rationalization

#	Candidate use case (one line)
1	Automated Request Prioritization
2	Automatic Request Routing
3	Duplicate Request Detection
4	Inventory Availability Check
5	Request Approval Tracking
6	SLA Monitoring and Escalation
7	Request Status Notifications
8	Software License Availability Check

Candidate	Impact ×3	Feas. ×2	Align. ×2	Urg. ×1	Risk −1	Weighted Total
Automated Request Prioritization	5	5	5	5	1	39
Automatic Request Routing	5	5	4	4	1	36
Duplicate Request Detection	4	4	4	5	1	32
Inventory Availability Check	5	3	5	5	2	31
Request Approval Tracking	4	4	4	4	1	31
SLA Monitoring and Escalation	4	4	5	4	1	31
Software License Availability Check	3	5	4	3	1	26

#	Candidate use case (one line)					
Software License Availability Check	4	3	4	3	2	25

Step 2 (10 min) — Value Mapping + ROI for your top pick

Field	Your answer
Business Goal	Reduce the IT equipment request backlog and ensure urgent requests are handled first.
Use Case	Automated Request Prioritization
KPI	Reduce the average time to identify and prioritize an equipment request from 1 day to 1 hour.
Value Delivered	Reduces manual effort, helps urgent requests get handled faster, and reduces the equipment request backlog.
Estimated ROI	Annual value/benefit = ₹4.8 lakh Estimated investment = ₹1.2 lakh ROI = (₹4.8L − ₹1.2L) ÷ ₹1.2L × 100 = ₹3.6L ÷ ₹1.2L × 100 = 300% ROI

Step 3 (3 min per group) — Write your pitch script

Part	Your script (1–2 sentences each)
1. Problem	Equipment requests are currently handled through emails and spreadsheets. This causes delays, makes urgent requests harder to identify, and can lead to duplicate orders.
2. Use Case	We want to automatically prioritize equipment requests so urgent requests are handled first.
3. Value & ROI	The estimated annual benefit is ₹4.8 lakh against an investment of ₹1.2 lakh, giving us a 300% ROI, or a 4× return on investment.
4. Feasibility	This is feasible because request information is already available through emails and the shared spreadsheet.

Part	Your script (1–2 sentences each)
5. The Ask	We are asking for approval to build an 8–10-week pilot and measure whether it reduces the backlog and saves time.

Step 4 — Peer scoring (fill in for OTHER groups' pitches)

Group pitching	Clarity (1–5)	Evidence (1–5)	Feasibility (1–5)	Total

Part D — Capstone: Continue Your Real-World Use Case

Return to the real organization and use case you developed in Session 1's Part D. Complete the same journey you just practiced on TechNova: weighted score, value map, ROI, feasibility, and a written pitch.

D1. Weighted Priority Score

Re-score your Session 1 candidates (Part D3) with all five weighted factors.

Candidate	Impact ×3	Feas. ×2	Align. ×2	Urg. ×1	Risk −1	Weighted Total
Maintenance Request Intake & Classification	5	5	5	5	1	39
Automatic Assignment to Maintenance Staff	5	4	5	4	1	34
Water / Electrical Issue Reporting	4	4	4	5	1	32
Cleaning Request Scheduling	4	4	4	4	1	31
SLA Escalation & Status Tracking	4	4	5	4	1	31
Hostel Room / Bed Allocation Requests	4	3	4	4	2	29
Inventory / Spare Parts Availability	3	3	4	3	2	25
Feedback & Recurring Issue Analysis	3	4	4	3	1	25

D2. Value Mapping Canvas

Field	Your answer
Business Goal	Reduce delays and manual coordination in handling hostel maintenance requests.
Use Case	Automated Maintenance Request Intake & Classification
KPI	Reduce average first-response time from 8 hours to 2 hours and automatically classify 80% of maintenance requests within 8–10 weeks.
Value Delivered	Saves hostel staff time, reduces missed or duplicated requests, improves visibility, and helps students get maintenance issues resolved faster.

D3. ROI & Feasibility

Line item	Your estimate
Monthly / annual value (show your math)	400 requests/month × 20 min ÷ 60 × ₹300/hour × 80% = ₹32,000/month; annual value = ₹32,000 × 12 = ₹3,84,000/year
Estimated build cost	₹1,20,000 for an 8–10 week pilot
ROI	(₹3,84,000 − ₹1,20,000) ÷ ₹1,20,000 = 2.2× = 220% ROI
Payback period	₹1,20,000 ÷ ₹32,000 ≈ 3.75 months

Lens	Score (1–5)	Why
Technical	5	Can use existing forms/email, a simple ticket workflow, and automated classification/routing.
Data	4	Request details, hostel/room information, issue categories, and ticket history are already available or can be captured in a standard form.
Organizational	4	Hostel staff and maintenance teams must adopt one standard intake process instead of calls, messages, and informal requests.

D4. Written Pitch (5 parts, ~150 words total)

Part	Your script
1. Problem	Hostel maintenance requests are currently raised through calls, messages, and informal communication. This can cause delays, missed requests, and poor visibility of urgent problems.
2. Use Case	We want to automatically capture and classify maintenance requests so each issue is recorded consistently and can be handled by the right maintenance team.
3. Value & ROI	The estimated annual value is ₹3.84 lakh against a ₹1.2 lakh investment, giving a 220% ROI and an estimated payback of about 3.75 months.
4. Feasibility	The solution is feasible because request information can be collected through a standard form and existing hostel records. The main requirement is adoption of the common process by hostel staff and students.
5. The Ask	We are asking for approval to build an 8–10 week pilot and measure first-response time, classification accuracy, request backlog, and staff time saved.

Grading Rubric

Deliverable	What we're looking for	Weight
Weighted Priority Score (Part D1)	All 5 factors scored honestly, weights applied correctly, ranking justified	20%
Value Mapping Canvas (Part D2)	Clear goal → use case → KPI → value chain, KPI is genuinely measurable	20%
ROI & Feasibility (Part D3)	Reasonable stated assumptions, math shown, all 3 feasibility lenses covered	25%
Written / Live Pitch (Part D4)	Hits all 5 pitch parts, fits the time limit, evidence-based, not just enthusiasm	35%

Submit this worksheet (Parts A–D completed) before Session 3.
